## FOREWORD

This report documents The Aerospace Corporation effort on Study 2.3, Systems Cost/Performance Analysis, performed under NASA Contracts NASW-2575 and NASW-2727 during Fiscal Years 1974 and 1975. The effort was directed by Mr. B. H. Campbell. Mr. R. D. Kramer, Marshall Space Flight Center and Mr. R. R. Carley, NASA Headquarters were the NASA Study Directors for this study. Their efforts in providing technical direction throughout the duration of the study are greatly appreciated.

This volume is one of three volumes of the final report for Study 2.3. The three volumes are:

Volume I	Executive Summary
Volume II	Systems Cost/Performance Model
Appendix	Data Base
Volume III	Programmer's Manual and User's Guide

Volume I summarizes the overall report. It includes the relationship of this study to other NASA efforts, significant results, study limitations, and suggested additional effort.

Volume II provides a detailed description of the Systems Cost/Performance Model. It also includes the model checkout and the results for three payload test cases. The Data Base is provided in the Appendix to Volume II.

Volume III provides a detailed description of how the Systems Cost/Performance Computer Program is organized and operates. The program listing, detailed flow charts and user restrictions are included.

## ACKNOWLEDGMENTS

The Aerospace Corporation effort on Study 2.3 was supported by Members of the Technical Staff (MTS) in various technical disciplines within the company. The contributions of the following MTS to the System Cost/Performance Analysis are gratefully acknowledged:

### Auxiliary Propulsion

R. W. Mascolo

### Communications

E. L. Tarca

### Computer Program

R. F. Janz

R. E. Rice

D. E. Sakaguchi

J. C. Thacker

### Cost

H. G. Campbell

D. W. Cochran

L. Raphael

### Data Processing

R. H. Arnold

### Electrical Power

D. Rufus

H. T. Sampson

### Reliability

G. H. Fuller

### Schedule

R. T. Dungan

### Stabilization and Control

R. M. Allman

B. E. Ayotte

### Structure

E. R. Johnson

### Thermal Control

H. H. Yoshikawa

### Vehicle Sizing

R. T. Blake

## 1. INTRODUCTION

This appendix contains data on selected payload equipments (components) which have been collected for the purpose of exercising the Systems Cost/Performance Model. The reader should be aware that, although most of the data is accurate, approximations based on engineering judgment and experience are used wherever actual data was unavailable. The approximations are justified by the objective of the study which was to develop a cost/performance model. Assuming that the model is successfully developed and is accepted for use by a body of users, the data base should be expanded and the approximations replaced by actual data. The following paragraphs are devoted to an explanation of how the data are organized and how to interpret the information contained on the data pages.

The equipments are organized according to the following subsystems which use the specific components:

- a. Stabilization and Control
- b. Auxiliary Propulsion
- c. Data Processing
- d. Communication
- e. Electrical Power

The data sheet for each component states which subsystem utilizes the component, which configurations require the component, which equipment type the component is categorized as, and the data base identifier or code number assigned to the component.

The data describing the component consist of the following four types:

- a. Performance
- b. Safety
- c. Cost
- d. Schedule

## 1.1 PERFORMANCE DATA

The performance data are separated into eight categories:

- a. Technical Characteristics
- b. Power
- c. Weight
- d. Volume
- e. Vibration
- f. Temperature
- g. Pressure
- h. CDPI

The technical characteristics are peculiar to each equipment type. Generally speaking, the technical characteristics provide the data required to select or differentiate among the components and additional data for the component which, if selected, provides information for design of the remainder of the subsystem.\*

The power data includes three basic descriptions: the power requirements, the voltage requirements, and the conversion requirements. The average power is the average power required by the component during its active state. The maximum power is the power required either during load conditions or during any high power transient periods. The minimum voltage requirement exists during quiescent periods, powered down periods, or the turned-off condition, if allowable.

The voltage requirements are the specifications for which the equipment is rated, i.e., the nominal voltage, and the maximum and minimum voltages for which the component will continue to perform within specifications.

If the specific component is selected, the converter/inverter requirement flag identifies any need for special power conversion equipment. Since the requirement is identified as a flag, the number used should correspond to the identifier for the actual converter or inverter required.

\*NA is used in the data base to signify that the data is not applicable.

The component weight includes all weight which is essential to performing the functions associated with the component. Examples of additional functional weight include:

- a. Telemetry instrumentation
- b. Failure sensing and switching
- c. Interface equipment which is not ordinarily a separate component as selected by the Systems Cost/Performance Model.

Weight which comes under different functional descriptions is not included. Examples are:

- a. Wiring harness
- b. Structural mountings

Volume is the direct counterpart of weight and is determined according to the same rules.

The vibration specification includes both random and nonrandom categories. Although vibration is not used in the current model, the intent is to use the specification in future models.

The maximum and minimum temperature information are the temperature specifications for which the equipment is qualified.

The pressure information is the ambient pressure for which the component is qualified.

The CDPI information for each component is used for the express purpose of designing the Data Processing and Communication Subsystems. Command requirements are divided into three categories: power, time tagged, and other. The telemetry requirements are separated into two categories, i.e., low rate and high rate telemetry requirements. The telemetry information includes:

- a. Number of analog telemetry points
- b. Number of digital telemetry points
- c. Sample rate
- d. Word length

## 1.2 SAFETY DATA

The intent in supplying the safety information is to indicate the failure mode, the numerics describing the failure mode, the redundancy type, and the maximum amount of redundancy. To this end, the failure model as stated in the data base indicates both the failure mode and the redundancy type. If the failure mode is modeled by an exponential, then the failure rate must be provided. Both the mean and standard deviation are supplied in the event of a normal (gaussian) failure mode. The dormancy factor must be provided for either failure mode. Because the Systems Cost/Performance Model can add an undesirable (from an engineering point of view) amount of redundancy, the total allowable number of redundant elements is specified. This redundancy number includes both the original number of components as well as the components added for the purpose of increasing system reliability.

## 1.3 COST DATA

Component cost information must be supplied for each of the following three categories:

- a. Design engineering
- b. Test and evaluation
- c. Unit production

An additional piece of information which must be provided is the reference quantity required to meet the performance requirements. Redundancy is not included in the reference quantity. A nondimensional factor has been provided for use in future models where the effect of standardization or use of off-the-shelf hardware is to be incorporated.

## 1.4 SCHEDULE DATA

Component schedule data includes both the development lead time and the qualification lead time. Each lead time is separated into a constant and a variable. Normally, the constant lead times will be exactly the same

for all components of the same type. In addition, a state-of-art factor is provided based on the component being in a state of development somewhere between off-the-shelf and a new concept requiring an advance in technology.

#### 1.5 ARTIFICIAL COMPONENTS

The focus of the current study has been on the development of a working model in deference to a complete user oriented operational program with an expanded data base. Only after the model was successfully developed and proven as a useful tool could data collection be justified at such a detailed level. Hence, certain artificial equipment descriptions were developed and placed in the data base for the express purpose of exercising and checking out the Cost/Performance Computer Program. The components having a 9 (e.g., S&C 1399) as the third digit in the equipment identifier were used to check out the macro search mode of the computer program. These components are summarized in Table 1-1. Components in the data base having a 5 (e.g., S&C 0151) as the third digit in the equipment identifier were used to check out the micro search mode. Table 1-2 lists these components.

Table 1-1. Artificial Components for Macro-Search

<u>Component Identifier</u>		<u>Equipment Type</u>	<u>Artificial Characteristics</u>	<u>Original Component</u>
S&C	1399	Reaction Wheel Assy.	Nominal momentum: 691 m-kg-sec (5000 ft-lb-sec)	1301

#### Performance

##### Technical Characteristics

- |      |                         |  |
|------|-------------------------|--|
| (1)  | Thrust level:           | 0.44 N (0.1 lb)                                |
| (2)  | Pulse life:             | 375,000 cycles                                 |
| (3)  | Inlet pressure:         | $1.72 \times 10^6$ N/m <sup>2</sup> (250 psia) |
| (4)  | Total impulse:*         | $7.43 \times 10^4$ N-sec (16,700 lb-sec)       |
| (5)  | ISP:*                   | 225 sec  |
| (6)  | Mixture ratio (N.D.):** |  |
| (7)  |                         |  |
| (8)  |                         |  |
| (9)  |                         |  |
| (10) |                         |  |

##### Power

- |  |      |
|--|------|
| Average Power (watts):                 | 1.0  |
| Maximum Power (watts):                 | 6.0  |
| Minimum Power (watts):                 | 0    |
| Nominal Voltage (volts):               | 28.0 |
| Maximum Voltage (volts):               | 32.0 |
| Minimum Voltage (volts):               | 24.0 |
| Converter/Inverter Requirement (flag): |      |

Weight (kg): 0.14 (0.3 lb)

Volume (cc): 850 (0.03 ft<sup>3</sup>)

##### Vibration

- |                  |      |
|------------------|------|
| Random (g, rms): | 21.0 |
| Non-Random (g):  |      |

##### Temperature

- |               |              |
|---------------|--------------|
| Maximum (°K): | 333 (140° F) |
| Minimum (°K): | 266 (20° F)  |

Pressure (kg/m<sup>2</sup>):

\*Applicable to monopropellant and bipropellant thrusters  
\*\*Applicable to bipropellant thrusters only
